Configuration Profile Key Reference

SwiftObjective-C

Note: This document was previously titled *iPhone Configuration Profile Reference*. It now supports both iOS and OS X.

[]

A configuration profile is an XML file that allows you to distribute configuration information. If you need to configure a large number of devices or to provide lots of custom email settings, network settings, or certificates to a large number of devices, configuration profiles are an easy way to do it.

A configuration profile contains a number of settings that you can specify, including:

Restrictions on device features

Wi-Fi settings

VPN settings

Email server settings

Exchange settings

LDAP directory service settings

CalDAV calendar service settings

Web clips

Credentials and keys

Configuration profiles are in property list format, with Data values stored in Base64 encoding. The .plist format can be read and written by any XML library.

There are five ways to deploy configuration profiles:

- Using Apple Configurator (iOS only)
- In an email message
- On a webpage
- Using over-the air configuration as described in Over-the-Air Profile Delivery and Configuration

Over the air using a Mobile Device Management Server

Both iOS and OS X support using encryption to protect the contents of profiles. Profiles can also be signed to guarantee data integrity. To learn about encrypted profile delivery, read *Over-the-Air Profile Delivery and Configuration*.

Devices can be supervised when preparing them for deployment with Apple Configurator (iOS 5 or later) or by using the Device Enrollment Program (iOS 7 or later). When a device is supervised, you can use profiles to control more of its settings. For more information about the Device Enrollment Program, visit Apple's iPad in Business or IT in the Classroom pages.

This document describes the keys in a configuration profile and provides examples of the resulting XML payloads.

Note: Before you get started working with configuration profiles, you should create a skeleton configuration profile. This provides a useful starting point that you can then modify as desired.

Configuration Profile Keys

At the top level, a profile property list contains the following keys:

Key	Туре	Content
PayloadContent	Array	Optional. Array of payload dictionaries. Not present if IsEncrypted is true.
PayloadDescription	String	Optional. A description of the profile, shown on the Detail screen for the profile. This should be descriptive enough to help the user decide whether to install the profile.
PayloadDisplayName	String	Optional. A human-readable name for the profile. This value is displayed on the Detail screen. It does not have to be unique.
PayloadExpiration— Date	Date	Optional. A date on which a profile is considered to have expired and can be updated over the air. This key is only used if the profile is delivered via Over The Air profile delivery.

Key	Туре	Content
PayloadIdentifier	String	A reverse-DNS style identifier (com.example.myprofile, for example) that identifies the profile. This string is used to determine whether a new profile should replace an existing one or should be added.
PayloadOrganization	String	Optional. A human-readable string containing the name of the organization that provided the profile.
PayloadUUID	String	A globally unique identifier for the profile. The actual content is unimportant, but it must be globally unique. In OS X, you can use uuidgen to generate reasonable UUIDs.
PayloadRemoval- Disallowed	Boolean	Optional. If present and set to true, the user cannot delete the profile (unless the profile has a removal password and the user provides it).
PayloadType	String	The only supported value is Configuration.
PayloadVersion	Number	The version number of the profile format. This describes the version of the configuration profile as a whole, not of the individual profiles within it. Currently, this value should be 1.
PayloadScope	String	Optional. Determines if the profile should be installed for the system or the user. In many cases, it determines the location of the certificate items, such as keychains. Though it is not possible to declare different payload scopes, payloads, like VPN, may automatically install their items in both scopes if needed. Legal values are System and User, with User as the default value.
		Availability: Available in OS X 10.7 and later.
RemovalDate	date	Optional. The date on which the profile will be automatically removed.
DurationUntilRemoval	float	Optional. Number of seconds until the profile is automatically removed. If the RemovalDate keys is present, whichever field yields the earliest date will be used.

Кеу	Туре	Content
ConsentText	Dictionary	Optional. This dictionary's keys must be locale strings that contain a canonicalized IETF BCP 47 language identifier. Additionally, the key default may be present to provide the default localization.
		The system chooses a localized version in the order of preference specified by the user (OS X) or based on the user's current language setting (iOS). If no exact match is found, the default localization is used. If there is no default localization, the "en" localization is used. If there is no "en" localization, then the first available localization is used.
		You should provide a default localization. No warning will be displayed if the user's locale does not match any of the localizations in the consentText dictionary.

Note: Profile payload dictionary keys that are prefixed with "Payload" are reserved key names and must never be treated as managed preferences. Any other key in the payload dictionary may be considered a managed preference for that preference domain.

Keys in the payload dictionary are described in detail in the next section.

Payload Dictionary Keys Common to All Payloads

If a PayloadContent value is provided in a payload, each entry in the array is a dictionary representing a configuration payload. The following keys are common to all payloads:

Key	Туре	Content
PayloadType	String	The payload type. The payload types are described in Payload-Specific Property Keys (page 10).
PayloadVersion	Number	The version number of the individual payload. A profile can consist of payloads with different version numbers. For example, changes to the VPN software in iOS might introduce a new payload version to support additional features, but Mail payload versions would not necessarily change in the same release.

Кеу	Туре	Content
PayloadIdentifier	String	A reverse-DNS-style identifier for the specific payload. It is usually the same identifier as the root-level PayloadIdentifier value with an additional component appended.
PayloadUUID	String	A globally unique identifier for the payload. The actual content is unimportant, but it must be globally unique. In OS X, you can use uuidgen to generate reasonable UUIDs.
PayloadDisplayName	String	Optional. A human-readable name for the profile payload. This name is displayed on the Detail screen. It does not have to be unique.
PayloadDescription	String	Optional. A human-readable description of this payload. This description is shown on the Detail screen.
PayloadOrganization	String	Optional. A human-readable string containing the name of the organization that provided the profile. The payload organization for a payload need not match the payload organization in the enclosing profile.

Payload-Specific Property Keys

In addition to the standard payload keys (described in Payload Dictionary Keys Common to All Payloads (page 9)), each payload type contains keys that are specific to that payload type. The sections that follow describe those payload-specific keys.

Active Directory Certificate Profile Payload

You can request a certificate from a Microsoft Certificate Authority using DCE/RPC and the Active Directory Certificate profile payload keys described at support.apple.com/kb/HT5357.

AirPlay Payload

The AirPlay payload is designated by specifying com.apple.airplay as the PayloadType value.

This payload is supported only on iOS 7.0 and later.

Key	Туре	Value
Whitelist	Array of dictionaries	Optional. Supervised only (ignored otherwise). If present, only AirPlay destinations present in this list are available to the device. The dictionary format is described below.
Passwords	Array of dictionaries	Optional. If present, sets passwords for known AirPlay destinations. The dictionary format is described below.

Each entry in the Whitelist array is a dictionary that can contain the following fields:

Key	Туре	Value
DeviceID	String	The Device ID of the AirPlay destination, in the format xx:xx:xx:xx:xx. This field is not case sensitive.

Each entry in the Passwords array is a dictionary that can contain the following fields:

Key	Туре	Value
DeviceName	String	The name of the AirPlay destination.
Password	String	The password for the AirPlay destination.

AirPrint Payload

The AirPrint payload adds AirPrint printers to the user's AirPrint printer list. This makes it easier to support environments where the printers and the devices are on different subnets. An AirPrint payload is designated by specifying com.apple.airprint as the PayloadType value.

This payload is supported only on iOS 7.0 and later.

Key	Туре	Value
AirPrint	Array of dictionaries	An array of AirPrint printers that should always be shown.

Each dictionary in the AirPrint array must contain the following keys and values:

Key	Туре	Value
IPAddress	String	The IP Address of the AirPrint destination.

Key	Туре	Value
ResourcePath	String	The Resource Path associated with the printer. This corresponds to the rp parameter of the _ipps.tcp Bonjour record. For example: printers/Canon_MG5300_series printers/Xerox_Phaser_7600 ipp/print Epson_IPP_Printer

APN Payload

The APN (Access Point Name) payload is designated by specifying com.apple.apn.managed as the PayloadType value.

In iOS 7 and later, the APN payload is deprecated in favor of the Cellular payload.

The APN Payload is not supported in OS X.

Кеу	Туре	Value
DefaultsData	Dictionary	This dictionary contains two key/value pairs.
DefaultsDomainName	String	The only allowed value is com.apple.managedCarrier.
apns	Array	This array contains an arbitrary number of dictionaries, each describing an APN configuration, with the key/value pairs below.
apn	String	This string specifies the Access Point Name.
username	String	This string specifies the user name for this APN. If it is missing, the device prompts for it during profile installation.
password	Data	Optional. This data represents the password for the user for this APN. For obfuscation purposes, the password is encoded. If it is missing from the payload, the device prompts for the password during profile installation.
Proxy	String	Optional. The IP address or URL of the APN proxy.
ProxyPort	Number	Optional. The port number of the APN proxy.

Per-App VPN Payload

The Per-App VPN payload is used for configuring add-on VPN software, and it works only on VPN services of type 'VPN'. It should not be confused with the standard VPN payload, described in VPN Payload (page 44).

This payload is supported only in iOS 7.0 and later and OS X v10.9 and later.

The VPN payload is designated by specifying com.apple.vpn.managed.applayer as the PayloadType value. The Per-App VPN payload supports all of the keys described in VPN Payload (page 44) plus the following additional keys:

Key	Туре	Value	
VPNUUID	String	A globally-unique identifier for this VPN configuration. This identifier is used to configure apps so that they use the Per-App VPN service for all of their network communication. See App-to-Per-App VPN Mapping (page 14).	
SafariDomains	Array	This optional key is a special case of App-to-Per App VPN Mapping. It sets up the app mapping for Safari (Webkit) with a specific identifier and a designated requirement.	
		The array contains strings, each of which is a domain that should trigger this VPN connection in Safari. The rule matching behavior is as follows:	
		 Before being matched against a host, all leading and trailing dots are stripped from the domain string. For example, if the domain string is ".com" the domain string used to match is "com". 	
		• Each label in the domain string must match an entire label in the host string. For example, a domain of "example.com" matches "www.example.com", but not "foo.badexample.com".	
		 Domain strings with only one label must match the entire host string. For example, a domain of "com" matches "com", not "www.example.com". 	

Key	Туре	Value
OnDemandMatch— AppEnabled	Boolean	This key is placed in the VPN payload sub-dictionary. If true, the Per-App VPN connection starts automatically when apps linked to this Per-App VPN service initiate network communication. If false, the Per-App VPN connection must be started manually by the user before apps linked to this Per-App VPN service can initiate
		network communication. If this key is not present, the value of the OnDemandEnabled key is used to determine the status of Per-App VPN On Demand.

App-to-Per-App VPN Mapping

The App-to-Per-App mapping payload is designated by specifying com.apple.vpn.managed.appmapping as the PayloadType value.

This payload is supported only in OS X v10.9 and later. It is not supported in iOS.

Key	Туре	Value
AppLayerVPNMapping	Array of dictionaries	An array of mapping dictionaries.

Each dictionary in the array can contain the following keys:

Кеу	Туре	Value
Identifier	String	The app's bundle ID.
VPNUUID	String	The VPNUUID of the Per-App VPN defined in a Per-App VPN payload.

App Lock Payload

The App Lock payload is designated by specifying com.apple.app.lock as the PayloadType value. Only one of this payload type can be installed at any time. This payload can be installed only on a Supervised device.

By installing an app lock payload, the device is locked to a single application until the payload is removed. The home button is disabled, and the device returns to the specified application automatically upon wake or reboot.

This payload is supported only in iOS 6.0 and later.

The payload contains the following key:

Key	Туре	Value
Арр	Dictionary	A dictionary containing information about the app.

The App dictionary, in turn, contains the following key:

Key	Туре	Value
Identifier	String	The bundle identifier of the application.
Options	Dictionary	Optional. Described below. Availability: Available only in iOS 7.0 and later.
UserEnabledOptions	Dictionary	Optional. Described below. Availability: Available only in iOS 7.0 and later.

The Options dictionary, if present, can contain the following keys (in iOS 7.0 and later):

Key	Туре	Value
DisableTouch	String	Optional. If true, the touch screen is disabled. Default is false.
DisableDeviceRotation	String	Optional. If true, device rotation sensing is disabled. Default is false.
DisableVolumeButtons	String	Optional. If true, the volume buttons are disabled. Default to false.
DisableRingerSwitch	String	Optional. If true, the ringer switch is disabled. Default is false. When disabled, the ringer behavior depends on what position the switch was in when it was first disabled.
DisableSleepWakeButton	String	Optional. If true, the sleep/wake button is disabled. Default is false.
DisableAutoLock	String	Optional. If true, the device will not automatically go to sleep after an idle period.
EnableVoiceOver	String	Optional. If true, VoiceOver is turned on. Default is false.
EnableZoom	String	Optional. If true, Zoom is turned on. Default is false.

Key	Туре	Value
EnableInvertColors	String	Optional. If true, Invert Colors is turned on. Default is false.
EnableAssistiveTouch	String	Optional. If true, AssistiveTouch is turned on. Default is false.
EnableSpeakSelection	String	Optional. If true, Speak Selection is turned on. Default is false.
EnableMonoAudio	String	Optional. If true, Mono Audio is turned on. Default is false.

The UserEnabledOptions dictionary, if present, can contain the following keys (in iOS 7.0 and later):

Кеу	Туре	Value
VoiceOver	String	Optional. If true, allow VoiceOver adjustment. Default is false.
Zoom	String	Optional. If true, allow Zoom adjustment. Default is false.
InvertColors	String	Optional. If true, allow Invert Colors adjustment. Default is false.
AssistiveTouch	String	Optional. If true, allow AssistiveTouch adjustment. Default is false.

CalDAV Payload

This payload configures a CalDAV account.

The payload is designated by specifying com.apple.caldav.account as the PayloadType

Кеу	Туре	Value
CalDAVAccount- Description	String	Optional. The description of the account.
CalDAVHostName	String	The server address. In OS X, this key is required.
CalDAVUsername	String	The user's login name. In OS X, this key is required.

Кеу	Туре	Value
CalDAVPassword	String	Optional. The user's password
CalDAVUseSSL	Boolean	Whether or not to use SSL. In OS X, this key is optional.
CalDAVPort	Number	Optional. The port on which to connect to the server.
CalDAVPrincipalURL	String	Optional. The base URL to the user's calendar. In OS X this URL is required if the user doesn't provide a password, because auto-discovery of the service will fail and the account won't be created.

Calendar Subscription Payload

The calendar subscription payload is designated by specifying com.apple.subscribedcalendar.account as the PayloadType value.

A calendar subscription payload adds a subscribed calendar to the user's calendars list.

The calendar subscription payload is not supported in OS X.

In addition to the settings common to all payloads, this payload defines the following keys:

Кеу	Туре	Value
SubCalAccountDescription	String	Optional. Description of the account.
SubCalAccountHostName	String	The server address.
SubCalAccountUsername	String	The user's login name
SubCalAccountPassword	String	The user's password.
SubCalAccountUseSSL	Boolean	Whether or not to use SSL.

CardDAV Payload

The CardDAV payload is designated by specifying com.apple.carddav.account as the PayloadType value.

This payload is only available in OS X v10.8 and later. As of OS X v10.8 and later, this payload type supports obtaining "CardDAVUsername" and "CardDAVPassword" from an Identification Payload, if present.

Key	Туре	Value
CardDAVAccountDescription	String	Optional. The description of the account.
CardDAVHostName	String	The server address.
CardDAVUsername	String	The user's login name.
CardDAVPassword	String	Optional. The user's password
CardDAVUseSSL	Boolean	Optional. Whether or not to use SSL.
CardDAVPort	Number	Optional. The port on which to connect to the server.
CalDAVPrincipalURL	String	Optional. The base URL to the user's calendar.

Cellular Payload

A cellular payload configures cellular network settings on the device. In iOS 7 and later, a cellular payload is designated by specifying com.apple.cellular as the PayloadType value. Cellular payloads have two important installation requirements:

- No more than one cellular payload can be installed at any time.
- A cellular payload cannot be installed if an APN payload is already installed.

This payload replaces the com.apple.managedCarrier payload, which is supported, but deprecated.

In addition to the settings common to all payloads, this payload defines the following keys:

Кеу	Туре	Value
AttachAPN	Dictionary	Optional. An AttachAPN configuration dictionary, described below.
APNs	Array	Optional. An array of APN dictionaries, described below. Only the first entry is currently used.

The AttachAPN dictionary contains the following keys:

Key	Туре	Value
Name	String	Required. A name for this configuration.
AuthenticationType	String	Optional. Must contain either CHAP or PAP. Defaults to PAP.

Key	Туре	Value
Username	String	Optional. A user name used for authentication.
Password	String	Optional. A password used for authentication.

Each APN dictionary contains the following keys:

Кеу	Туре	Value
Name	String	Required. A name for this configuration.
AuthenticationType	String	Optional. Must contain either CHAP or PAP. Defaults to PAP.
Username	String	Optional. A user name used for authentication.
Password	String	Optional. A password used for authentication.
ProxyServer	String	Optional. The proxy server's network address.
ProxyPort	Number	Optional. The proxy server's port.

Certificate Payload

The PayloadType of a certificate payload must be one of the following:

Payload type	Container format	Certificate type
com.apple.security.root	PKCS#1(.cer)	Alias for com.apple.security.pkcs1.
com.apple.security.pkcs1	PKCS#1(.cer)	DER-encoded certificate without private key. May contain root certificates.
com.apple.security.pem	PKCS#1(.cer)	PEM-encoded certificate without private key. May contain root certificates.
com.apple.security.pkcs12	PKCS#12(.p12)	Password-protected identity certificate. Only one certificate may be included.

Кеу	Туре	Value
PayloadCertificate- FileName	String	Optional. The file name of the enclosed certificate.

Кеу	Туре	Value
PayloadContent	Data	Mandatory. The binary representation of the payload.
Password	String	Optional. For PKCS#12 certificates, contains the password to the identity.

Caution: Because the password string is stored in the clear in the profile, it is recommended that the profile be encrypted for the device.

Email Payload

The email payload is designated by specifying com.apple.mail.managed as the PayloadType value.

An email payload creates an email account on the device.

Key	Туре	Value
EmailAccount- Description	String	Optional. A user-visible description of the email account, shown in the Mail and Settings applications.
EmailAccountName	String	Optional. The full user name for the account. This is the user name in sent messages, etc.
EmailAccountType	String	Allowed values are EmailTypePOP and EmailTypeIMAP. Defines the protocol to be used for that account.
EmailAddress	String	Designates the full email address for the account. If not present in the payload, the device prompts for this string during profile installation.
IncomingMailServer— Authentication	String	Designates the authentication scheme for incoming mail. Allowed values are EmailAuthPassword and EmailAuthNone.
IncomingMailServer- HostName	String	Designates the incoming mail server host name (or IP address).
IncomingMailServer- PortNumber	Number	Optional. Designates the incoming mail server port number. If no port number is specified, the default port for a given protocol is used.

Кеу	Туре	Value
IncomingMailServer- UseSSL	Boolean	Optional. Default true. Designates whether the incoming mail server uses SSL for authentication.
IncomingMailServer- Username	String	Designates the user name for the email account, usually the same as the email address up to the @ character. If not present in the payload, and the account is set up to require authentication for incoming email, the device will prompt for this string during profile installation.
IncomingPassword	String	Optional. Password for the Incoming Mail Server. Use only with encrypted profiles.
OutgoingPassword	String	Optional. Password for the Outgoing Mail Server. Use only with encrypted profiles.
OutgoingPasswordSame— AsIncomingPassword	Boolean	Optional. If set, the user will be prompted for the password only once and it will be used for both outgoing and incoming mail.
OutgoingMailServer- Authentication	String	Designates the authentication scheme for outgoing mail. Allowed values are EmailAuthPassword and EmailAuthNone.
OutgoingMailServer- HostName	String	Designates the outgoing mail server host name (or IP address).
OutgoingMailServer- PortNumber	Number	Optional. Designates the outgoing mail server port number. If no port number is specified, ports 25, 587 and 465 are used, in this order.
OutgoingMailServer- UseSSL	Boolean	Optional. Default Yes. Designates whether the outgoing mail server uses SSL for authentication.
OutgoingMailServer- Username	String	Designates the user name for the email account, usually the same as the email address up to the @ character. If not present in the payload, and the account is set up to require authentication for outgoing email, the device prompts for this string during profile installation.
PreventMove	Boolean	Optional. Default false. If true, messages may not be moved out of this email account into another account. Also prevents forwarding or replying from a different account than the message was originated from. Availability: Available only in iOS 5.0 and later.

Кеу	Туре	Value
PreventAppSheet	Boolean	Optional. Default false. If true, this account is not available for sending mail in third-party applications. Availability: Available only in iOS 5.0 and later.
SMIMEEnabled	Boolean	Optional. Default false. If true, this account supports S/MIME. Availability: Available only in iOS 5.0 and later.
SMIMESigning- CertificateUUID	String	Optional. The Pay loadUUID of the identity certificate used to sign messages sent from this account. Availability: Available only in iOS 5.0 and later.
SMIMEEncryption- CertificateUUID	String	Optional. The Pay loadUUID of the identity certificate used to decrypt messages coming into this account. Availability: Available only in iOS 5.0 and later.
SMIMEEnablePer- MessageSwitch	Boolean	Optional. If set to true, enable the per-message signing and encryption switch. Defaults to false.
disableMailRecents— Syncing	Boolean	If true, this account is excluded from address Recents syncing. This defaults to false. Availability: Available only in iOS 6.0 and later.

Exchange Payload

In iOS, the Exchange payload is designated by specifying com. apple.eas.account as the PayloadType value. This payload configures an Exchange Active Sync account on the device.

In OS X, the Exchange payload is designated by specifying com_apple_ews_account as the PayloadType value. This payload will configure an Exchange Web Services account for Contacts, Mail, Notes, Reminders, and Calendar.

Key	Туре	Value	
Available in both iOS and OS X			

Кеу	Туре	Value
EmailAddress	String	Specifies the full email address for the account. If not present in the payload, the device prompts for this string during profile installation. In OS X, this key is required.
Host	String	Specifies the Exchange server host name (or IP address). In OS X, this key is required.
SSL	Boolean	Optional. Default YES. Specifies whether the Exchange server uses SSL for authentication.
UserName	String	This string specifies the user name for this Exchange account. If missing, the devices prompts for it during profile installation. In OS X, this key is required.
Password	String	Optional. The password of the account. Use only with encrypted profiles.
	Availa	able in iOS only
Certificate	NSData blob	Optional. For accounts that allow authentication via certificate, a .p12 identity certificate in NSData blob format.
CertificateName	String	Optional. Specifies the name or description of the certificate.
CertificatePassword	data	Optional. The password necessary for the p12 identity certificate. Used with mandatory encryption of profiles.
PreventMove	Boolean	Optional. Default false. If set to true, messages may not be moved out of this email account into another account. Also prevents forwarding or replying from a different account than the message was originated from. Availability: Available in iOS 5.0 and later.
PreventAppSheet	Boolean	Optional. Default false. If set to true, this account will not be available for sending mail in third party applications. Availability: Available in iOS 5.0 and later.

Key	Туре	Value		
PayloadCertificate- UUID	String	UUID of the certificate payload to use for the identity credential. If this field is present, the Certificate field is not used. Availability: Available in iOS 5.0 and later.		
SMIMEEnabled	Boolean	Optional. Default false. If set to true, this account supports S/MIME. Availability: Available in iOS 5.0 and later.		
SMIMESigning- CertificateUUID	String	Optional. The PayloadUUID of the identity certificate used to sign messages sent from this account. Availability: Available in iOS 5.0 and later.		
SMIMEEncryption— CertificateUUID	String	Optional. The PayloadUUID of the identity certificate used to decrypt messages coming into this account. Availability: Available in iOS 5.0 and later.		
SMIMEEnablePer- MessageSwitch	Boolean	Optional. If set to true, enable the per-message signing and encryption switch. Defaults to false.		
disableMailRecents- Syncing	Boolean	If true, this account is excluded from address Recents syncing. This defaults to false. Availability: Available only in iOS 6.0 and later.		
MailNumberOfPast- DaysToSync	Integer	The number of days since synchronization.		
HeaderMagic	String	Optional. A magic string. If this field is provided, the string is sent as the value of the X-Apple-Config-Magic header in each EAS HTTP request. Availability: Available only in iOS 7.0 and later.		
	Available in OS X Only			
Path	String	Optional.		
Port	Number	Optional.		
ExternalHost	String	Optional.		
ExternalSSL	Boolean	Optional.		

Key	Туре	Value
ExternalPath	String	Optional.
ExternalPort	Number	Optional.

Note: Note: As with VPN and Wi-Fi configurations, it is possible to associate an SCEP credential with an Exchange configuration via the PayloadCertificateUUID key.

FileVault 2

In OS X 10.9, you can use FileVault 2 to perform full XTS-AES 128 encryption on the contents of a volume. FileVault 2 payloads are designated by specifying com.apple.MCX.FileVault2 as the PayloadType value. Removal of the FileVault payload does not disable FileVault.

Key	Туре	Value
Enable	String	Set to 'On' to enable FileVault. Set to 'Off' to disable FileVault. This value is required.
Defer	Boolean	Set to true to defer enabling FileVault until the designated user logs out.
UserEntersMissing- Info	Boolean	Set to true for manual profile installs to prompt for missing user name or password fields.
UseRecoveryKey	Boolean	Set to true to create a personal recovery key.
ShowRecoveryKey	Boolean	Set to true to display the personal recovery key to the user after FileVault is enabled.
OutputPath	String	Path to the location where the recovery key and computer information plist will be stored.
Certificate	Data	DER-encoded certificate data if an institutional recovery key will be added.
PayloadCertificate— UUID	String	UUID of the payload containing the asymmetric recovery key certificate payload.
Username	String	User name of the Open Directory user that will be added to FileVault.

Кеу	Туре	Value
Password	String	User password of the Open Directory user that will be added to FileVault. Use the UserEntersMissingInfo key if you want to prompt for this information.
UseKeychain	Boolean	If set to true and no certificate information is provided in this payload, the keychain already created at /Library/Keychains/FileVaultMaster.keychain will be used when the institutional recovery key is added.

A personal recovery user will normally be created unless the UseRecoveryKey key value is false. An institutional recovery key will be created only if either there is certificate data available in the Certificate key value, a specific certificate payload is referenced, or the UseKeychain key value is set to true and a valid FileVaultMaster. keychain file was created. In all cases, the certificate information must be set up properly for FileVault or it will be ignored and no institutional recovery key will be set up.

FileVault Recovery Key Redirection Payload

FileVault full-volume encryption (FDE) recovery keys are, by default, sent to Apple if the user requests it. With this key, you can redirect those recovery keys to a corporate server. FileVault Recovery Key Redirection payloads are designated by specifying com.apple.security.FDERecoveryRedirect as the PayloadType value. Only one payload of this type is allowed per system.

A site providing support for archiving the recovery key must implement its own HTTPS server. The client issues a POST request to the server with XML data in the request body containing the recovery key and serial number of the client computer. The server must respond with XML data echoing the device's serial number and provide a RecordNumber, which can be any data that locates the recovery key.

The SSL certificate chain of the server is evaluated by the client, which must trust it. If needed, the configuration profile can include an additional certificate to set up a chain of trust.

Кеу	Туре	Value
RedirectURL	String	The URL to which FDE recovery keys should be sent instead of Apple. Must begin with https://.
EncryptCertPayload- UUID	String	The UUID of a payload within the same profile that contains a certificate whose public key is used to encrypt the recovery key when it is sent to the redirected URL. The referenced payload must be of type com.apple.security.pkcs1.

Once installed, this payload causes any FileVault recovery keys to be redirected to the specified URL instead of being sent to Apple. This will require sites to implement their own HTTPS server that will receive the recovery keys via a POST request.

This payload is valid only in system-scoped profiles (where PayloadScope is System). Installing more than one payload of this type per machine causes an error. The SSL certificate chain of the server is evaluated by the client, which must trust it. If needed, the configuration profile may contain another payload with the server's root certificate to be marked as trusted when the profile is installed.

FileVault Client Request

The client issues a HTTPS POST request to the server with XML data containing the following:

Key	Туре	Value
VersionNumber	String	Currently set to '1.0'.
SerialNumber	String	The serial number of the client computer. The server must include this value in its response back to the client (see below).
RecoveryKeyCMS64	String	The recovery key encrypted using the encryption certificate provided in the configuration profile (referenced by the EncryptCertPayloadUUID key). The encrypted payload contains only the recovery key string without any XML wrapper. The encrypted data is wrapped in a CMS envelope and is then Base-64 encoded.

These tags are enclosed within a parent FDECaptureReguest tag. An example of an XML message body is:

```
[<]FDECaptureRequest[&#62;]
[&#60;]VersionNumber[&#62;]1.0[&#60;]/VersionNumber[&#62;]
[&#60;]SerialNumber[&#62;]A02FE08UCC8X[&#60;]/SerialNumber[&#62;]
[&#60;]RecoveryKeyCMS64>MIAGCSqGSIb3DQEHA ...
AAAAAAAAA==[&#60;]/RecoveryKeyCMS64[&#62;]
[&#60;]/FDECaptureRequest[&#62;]
```

FileVault Server Response

Upon receiving the client's request, the server must respond to the client with XML data containing:

Кеу	Туре	Value
SerialNumber	String	The serial number of the client computer. This value must be the same as the one sent in the request.
RecordNumber	Short string	This value must be nonempty but otherwise is up to the site to define it. This value will be displayed to the user along with the serial number on the EFI login screen when the user is asked to enter the recovery key. As an example, this could be a value to assist the site administrator in locating or verifying the user's recovery key in a database.

Font Payload

A Font payload lets you add an additional font to an iOS device. Font payloads are designated by specifying com.apple.font as the PayloadType value. You can include multiple Font payloads, as needed.

A Font payload contains the following keys:

Key	Туре	Value
Name	String	Optional. The user-visible name for the font. This field is replaced by the actual name of the font after installation.
Font	Data	The contents of the font file.

Each payload must contain exactly one font file in TrueType (.ttf) or OpenType (.otf) format. Collection formats (.ttc or .otc) are not supported.

Important: Fonts are identified by their embedded PostScript names. Two fonts with the same PostScript name are considered to be the same font even if their contents differ. Installing two different fonts with the same PostScript name is not supported, and the resulting behavior is undefined.

Global HTTP Proxy Payload

The Global HTTP Proxy payload is designated by specifying com.apple.proxy.http.global as the PayloadType.

This payload allows you to specify global HTTP proxy settings.

There can only be one of this payload at any time. This payload can only be installed on a supervised device.

Кеу	Туре	Value
ProxyType	String	If you choose manual proxy type, you need the proxy server address including its port and optionally a username and password into the proxy server. If you choose auto proxy type, you can enter a proxy autoconfiguration (PAC) URL.
ProxyServer	String	The proxy server's network address.
ProxyPort	Number	The proxy server's port
ProxyUsername	String	Optional. The username used to authenticate to the proxy server.
ProxyPassword	String	Optional. The password used to authenticate to the proxy server.
ProxyPACURL	String	Optional. The URL of the PAC file that defines the proxy configuration.
ProxyPACFallback- Allowed	Boolean	Optional. If false, prevents the device from connecting directly to the destination if the PAC file is unreachable. Default is true. Availability: Available in iOS 7 and later.
ProxyCaptiveLogin— Allowed	Boolean	Optional. If true, allows the device to bypass the proxy server to display the login page for captive networks. Default is false. Availability: Available in iOS 7 and later.

If the ProxyType field is set to Auto and no ProxyPACURL value is specified, the device uses the web proxy autodiscovery protocol (WPAD) to discover proxies.

Identification Payload

The Identification payload is designated by specifying com.apple.configurationprofile.identification value as the PayloadType value.

This payload allows you to save names of the account user and prompt text. If left blank, the user has to provide this information when he or she installs the profile.

The Identification payload is not supported in iOS.

Кеу	Туре	Value
FullName	String	The full name of the designated accounts.
EmailAddress	String	The address for the accounts.
UserName	String	The UNIX user name for the accounts.
Password	String	You can provide the password or choose to have the user provide it when he or she installs the profile.
Prompt	String	Custom instruction for the user, if needed.

LDAP Payload

The LDAP payload is designated by specifying com.apple.ldap.account as the PayloadType value.

An LDAP payload provides information about an LDAP server to use, including account information if required, and a set of LDAP search policies to use when querying that LDAP server.

Кеу	Туре	Value
LDAPAccount- Description	String	Optional. Description of the account.
LDAPAccountHostName	String	The host.
LDAPAccountUseSSL	Boolean	Whether or not to use SSL.
LDAPAccountUserName	String	Optional. The username.
LDAPAccountPassword	String	Optional. Use only with encrypted profiles.
LDAPSearchSettings [Dictionary	Top level container object. Can have many of these for one account. Should have at least one for the account to be useful.
		Each LDAPSearchSettings object represents a node in the LDAP tree to start searching from, and tells what scope to search in (the node, the node plus one level of children, or the node plus all levels of children).
LDAPSearchSetting- Description	String	Optional. Description of this search setting.

Кеу	Туре	Value
LDAPSearchSetting- SearchBase	String	Conceptually, the path to the node where a search should start. For example: ou=people, o=example corp
LDAPSearchSetting— Stope	String	Defines what recursion to use in the search. Can be one of the following 3 values: LDAPSearchSettingScopeBase: Just the immediate node pointed to by SearchBase
		LDAPSearchSettingScopeOneLevel: The node plus its immediate children.
		LDAPSearchSettingScopeSubtree: The node plus all children, regardless of depth.

Passcode Policy Payload

The Passcode Policy payload is designated by specifying com.apple.mobiledevice.passwordpolicy as the PayloadType value.

The presence of this payload type prompts device to present the user with an alphanumeric passcode entry mechanism, which allows the entry of arbitrarily long and complex passcodes.

Кеу	Туре	Value
allowSimple	Boolean	Optional. Default true. Determines whether a simple passcode is allowed. A simple passcode is defined as containing repeated characters, or increasing/decreasing characters (such as 123 or CBA). Setting this value to false is synonymous to setting minComplexChars to "1".
forcePIN	Boolean	Optional. Default NO. Determines whether the user is forced to set a PIN. Simply setting this value (and not others) forces the user to enter a passcode, without imposing a length or quality.
maxFailedAttempts	Number	Optional. Default 10 (iOS only). Allowed range [110]. Specifies the number of allowed failed attempts to enter the passcode at the device's lock screen. Once this number is exceeded, the device is locked and must be connected to its designated iTunes in order to be unlocked.

Key	Туре	Value
maxInactivity	Number	Optional. Default Infinity. Specifies the number of minutes for which the device can be idle (without being unlocked by the user) before it gets locked by the system. Once this limit is reached, the device is locked and the passcode must be entered. In OS X, this will be translated to screensaver settings.
maxPINAgeInDays	Number	Optional. Default Infinity. Specifies the number of days for which the passcode can remain unchanged. After this number of days, the user is forced to change the passcode before the device is unlocked.
minComplexChars	Number	Optional. Default 0. Specifies the minimum number of complex characters that a passcode must contain. A "complex" character is a character other than a number or a letter, such as &%\$#.
minLength	Number	Optional. Default 0. Specifies the minimum overall length of the passcode. This parameter is independent of the also optional minComplexChars argument.
requireAlphanumeric	Boolean	Optional. Default NO. Specifies whether the user must enter alphabetic characters ("abcd"), or if numbers are sufficient.
pinHistory	Number	Optional. When the user changes the passcode, it has to be unique within the last N entries in the history. Minimum value is 1, maximum value is 50.
maxGracePeriod	Number	Optional. The maximum grace period, in minutes, to unlock the phone without entering a passcode. Default is 0, that is no grace period, which requires a passcode immediately. In OS X, this will be translated to screensaver settings.

Profile Removal Password Payload

The Removal Password payload is designated by specifying com.apple.profileRemovalPassword value as the PayloadType value.

A password removal policy payload provides a password to allow users to remove a locked configuration profile from the device. If this payload is present and has a password value set, the device asks for the password when the user taps a profile's Remove button. This payload is encrypted with the rest of the profile.

Кеу	Туре	Value
RemovalPassword	String	Optional. Specifies the removal password for the profile.

Restrictions Payload

The Restrictions payload is designated by specifying com.apple.applicationaccess as the PayloadType value.

A Restrictions payload allows the administrator to restrict the user from doing certain things with the device, such as using the camera.

Note: You can specify additional restrictions, including mazimum allowed content ratings, by creating a profile using Apple Configurator or Profile Manager.

The Restrictions payload is not supported in OS X.

Кеу	Туре	Value
allowAccount— Modification	Boolean	Optional. Supervised only. If set to false, account modification is disabled. Availability: Available only in iOS 7.0 and later.
allowAddingGame- CenterFriends	Boolean	Optional. When false, prohibits adding friends to Game Center.
allowAirDrop	Boolean	Optional. Supervised only. If set to false, AirDrop is disabled. Availability: Available only in iOS 7.0 and later.
allowAppCellularData— Modification	Boolean	Optional. Supervised only. If set to false, changes to cellular data usage for apps are disabled. Availability: Available only in iOS 7.0 and later.
allowAppInstallation	Boolean	Optional. When false, the App Store is disabled and its icon is removed from the Home screen. Users are unable to install or update their applications.
allowAppRemoval	Boolean	Optional. When false, disables removal of apps from iOS device.

Key	Туре	Value
allowAssistant	Boolean	Optional. When false, disables Siri. Defaults to true.
allowAssistantUser- GeneratedContent	Boolean	Optional. Supervised only. When false, prevents Siri from querying user-generated content from the web. Availability: Available in iOS 7 and later.
allowAssistant- WhileLocked	Boolean	Optional. When false, the user is unable to use Siri when the device is locked. Defaults to true. This restriction is ignored if the device does not have a passcode set. Availability: Available only in iOS 5.1 and later.
allowBookstore	Boolean	Optional. Supervised only. If set to false, iBookstore will be disabled. This will default to true. Availability: Available in iOS 6.0 and later.
allowBookstore- Erotica	Boolean	Optional. Supervised only prior to iOS 6.1. If set to false, the user will not be able to download media from the iBookstore that has been tagged as erotica. This will default to true. Availability: Available in iOS 6.0 and later.
allowCamera	Boolean	Optional. When false, the camera is completely disabled and its icon is removed from the Home screen. Users are unable to take photographs.
allowChat	Boolean	Optional. When false, disables the use of the Messages app with supervised devices. Availability: Available in iOS 6.0 and later.
allowCloudBackup	Boolean	Optional. When false, disables backing up the device to iCloud. Availability: Available in iOS 5.0 and later.
allowCloudDocument- Sync	Boolean	Optional. When false, disables document and key-value syncing to iCloud. Availability: Available in iOS 5.0 and later.
allowCloudKeychain— Sync	Boolean	Optional. If false, disables Cloud keychain synchronization. Default is true. Availability: Available only in iOS 7.0 and later.

Key	Туре	Value
allowDiagnostic- Submission	Boolean	Optional. When false, this prevents the device from automatically submitting diagnostic reports to Apple. Defaults to true. Availability: Available only in iOS 6.0 and later.
allowExplicitContent	Boolean	Optional. When false, explicit music or video content purchased from the iTunes Store is hidden. Explicit
		content is marked as such by content providers, such as record labels, when sold through the iTunes Store.
allowFindMyFriends- Modification	Boolean	Optional. Supervised only. If set to false, changes to Find My Friends are disabled.
		Availability: Available only in iOS 7.0 and later.
allowFingerprint- ForUnlock	Boolean	Optional. If false, prevents Touch ID from unlocking a device.
		Availability: Available in iOS 7 and later.
allowGameCenter	Boolean	Optional. Supervised only. When false, Game Center is disabled and its icon is removed from the Home screen. Default is true.
		Availability: Available only in iOS 6.0 and later.
allowGlobal- BackgroundFetchWhen- Roaming	Boolean	Optional. When false, disables global background fetch activity when an iOS phone is roaming.
allowInAppPurchases	Boolean	Optional. When false, prohibits in-app purchasing.
allowLockScreen- ControlCenter	Boolean	Optional. If false, prevents Control Center from appearing on the Lock screen.
		Availability: Available in iOS 7 and later.
allowHostPairing	Boolean	Supervised only. If set to false, host pairing is disabled with the exception of the supervision host. If no supervision host certificate has been configured, all pairing is disabled. Host pairing lets the administrator control which devices an iOS 7 device can pair with. Availability: Available only in iOS 7.0 and later.
allowLockScreen- NotificationsView	Boolean	Optional. If set to false, the Notifications view in Notification Center on the lock screen is disabled.
NOTTITEATTONSVIEW		Availability: Available only in iOS 7.0 and later.

Key	Туре	Value
allowLockScreen— TodayView	Boolean	Optional. If set to false, the Today view in Notification Center on the lock screen is disabled. Availability: Available only in iOS 7.0 and later.
allowMultiplayer- Gaming	Boolean	Optional. When false, prohibits multiplayer gaming.
allowOpenFromManaged— ToUnmanaged	Boolean	Optional. If false, documents in managed apps and accounts only open in other managed apps and accounts. Default is true. Availability: Available only in iOS 7.0 and later.
allowOpenFrom- UnmanagedToManaged	Boolean	Optional. If set to false, documents in unmanaged apps and accounts will only open in other unmanaged apps and accounts. Default is true. Availability: Available only in iOS 7.0 and later.
allowOTAPKIUpdates	Boolean	Optional. If false, over-the-air PKI updates are disabled. Setting this restriction to false does not disable CRL and OCSP checks. Default is true. Availability: Available only in iOS 7.0 and later.
allowPassbook- WhileLocked	Boolean	Optional. If set to false, Passbook notifications will not be shown on the lock screen. This will default to true. Availability: Available in iOS 6.0 and later.
allowPhotoStream	Boolean	Optional. When false, disables Photo Stream. Availability: Available in iOS 5.0 and later.
allowSafari	Boolean	Optional. When false, the Safari web browser application is disabled and its icon removed from the Home screen. This also prevents users from opening web clips.
safariAllowAutoFill	Boolean	Optional. When false, Safari auto-fill is disabled. Defaults to true.
safariForceFraud- Warning	Boolean	Optional. When true, Safari fraud warning is enabled. Defaults to false.
safariAllow- JavaScript	Boolean	Optional. When false, Safari will not execute JavaScript. Defaults to true.

Key	Туре	Value
safariAllowPopups	Boolean	Optional. When false, Safari will not allow pop-up tabs. Defaults to true.
safariAcceptCookies	Integer	Optional. Determines conditions under which the device will accept cookies. Following are allowed values: • 0: Never • 1: From visited sites only • 2: Always Defaults to 2.
allowScreenShot	Boolean	Optional. When false, users are unable to save a screenshot of the display.
allowSharedStream	Boolean	Optional. If set to false, Shared Photo Stream will be disabled. This will default to true. Availability: Available in iOS 6.0 and later.
allowUIConfiguration— ProfileInstallation	Boolean	Optional. Supervised only. If set to false, the user is prohibited from installing configuration profiles and certificates interactively. This will default to true. Availability: Available in iOS 6.0 and later.
allowUntrusted— TLSPrompt	Boolean	Optional. When false, automatically rejects untrusted HTTPS certificates without prompting the user. Availability: Available in iOS 5.0 and later.
allowVideo- Conferencing	Boolean	Optional. When false, disables video conferencing.
allowVoiceDialing	Boolean	Optional. When false, disables voice dialing.
allowYouTube	Boolean	Optional. When false, the YouTube application is disabled and its icon is removed from the Home screen. This key is ignored in iOS 6 and later because the YouTube app is not provided.
allowiTunes	Boolean	Optional. When false, the iTunes Music Store is disabled and its icon is removed from the Home screen. Users cannot preview, purchase, or download content.

Key	Туре	Value
autonomousSingleApp- ModePermittedAppIDs	Array of strings	Optional. Supervised only. If present, allows apps identified by the bundle IDs listed in the array to autonomously enter Single App Mode. Availability: Available only in iOS 7.0 and later.
forceAssistant- ProfanityFilter	Boolean	Optional. When true, forces the use of the profanity filter assistant.
forceEncryptedBackup	Boolean	Optional. When true, encrypts all backups.
forceITunesStore- PasswordEntry	Boolean	Optional. When true, forces user to enter their iTunes password for each transaction. Availability: Available in iOS 5.0 and later.
forceLimitAdTracking	Boolean	Optional. If true, limits ad tracking. Default is false. Availability: Available only in iOS 7.0 and later.
forceAirPlayOutgoing- RequestsPairing- Password	Boolean	Optional. If set to true, forces all devices receiving AirPlay requests from this device to use a pairing password. Default is false. Availability: Available only in iOS 7.1 and later.
<pre>forceAirPlayIncoming- RequestsPairing- Password</pre>	Boolean	Optional. If set to true, forces all devices sending AirPlay requests to this device to use a pairing password. Default is false. Availability: Available only in Apple[]TV[]6.1 and later.
allowManagedApps- CloudSync	Boolean	Optional. If set to false, prevents managed applications from using cloud sync.
allowEraseContent- AndSettings	Boolean	Supervised only. If set to false, disables the "Erase All Content And Settings" option in the Reset UI.
allowSpotlight- InternetResults	Boolean	Supervised only. If set to false, Spotlight will not return Internet search results.
allowEnabling- Restrictions	Boolean	Supervised only. If set to false, disables the "Enable Restrictions" option in the Restrictions UI in Settings.
allowActivity- Continuation	Boolean	If set to false, Activity Continuation will be disabled. Defaults to true.

Кеу	Туре	Value
allowEnterprise- BookBackup	Boolean	If set to false, Enterprise books will not be backed up. Defaults to true.
allowEnterpriseBook- MetadataSync	Boolean	If set to false, Enterprise books notes and highlights will not be synced. Defaults to true.
allowPodcasts	Boolean	Supervised only. If set to false, disables podcasts. Defaults to true. Availability: Available in iOS 8.0 and later.
allowDefinition— Lookup	Boolean	Supervised only. If set to false, disables definition lookup. Defaults to true. Availability: Available in iOS 8.1.3 and later.
allowPredictive- Keyboard	Boolean	Supervised only. If set to false, disables predictive keyboards. Defaults to true. Availability: Available in iOS 8.1.3 and later.
allowAutoCorrection	Boolean	Supervised only. If set to false, disables keyboard auto-correction. Defaults to true. Availability: Available in iOS 8.1.3 and later.
allowSpellCheck	Boolean	Supervised only. If set to false, disables keyboard spell-check. Defaults to true. Availability: Available in iOS 8.1.3 and later.

SCEP Payload

The SCEP (Simple Certificate Enrollment Protocol) payload is designated by specifying com.apple.security.scep as the PayloadType value.

An SCEP payload automates the request of a client certificate from an SCEP server, as described in *Over-the-Air Profile Delivery and Configuration*.

In addition to the settings common to all payloads, this payload defines the following keys:

Кеу	Туре	Value
URL	String	The SCEP URL. See <i>Over-the-Air Profile Delivery and Configuration</i> for more information about SCEP.

Key	Туре	Value
Name	String	Optional. Any string that is understood by the SCEP server. For example, it could be a domain name like example.org. If a certificate authority has multiple CA certificates this field can be used to distinguish which is required.
Subject	Array	Optional. The representation of a X.500 name represented as an array of OID and value. For example, /C=US/0=Apple Inc./CN=foo/1.2.5.3=bar, which would translate to: [[["C", "US"]], [["0", "Apple Inc."]],, [["1.2.5.3", "bar"]]] OIDs can be represented as dotted numbers, with shortcuts for country (C), locality (L), state (ST), organization (0), organizational unit (0U), and common name (CN).
Challenge	String	Optional. A pre-shared secret.
Keysize	Number	Optional. The key size in bits, either 1024 or 2048.
Кеу Туре	String	Optional. Currently always "RSA".
Key Usage	Number	Optional. A bitmask indicating the use of the key. 1 is signing, 4 is encryption, 5 is both signing and encryption. Some certificate authorities, such as Windows CA, support only encryption or signing, but not both at the same time. Availability: Available only in iOS 4 and later.

SubjectAltName Dictionary Keys

The SCEP payload can specify an optional SubjectAltName dictionary that provides values required by the CA for issuing a certificate. You can specify a single string or an array of strings for each key.

The values you specify depend on the CA you're using, but might include DNS name, URL, or email values. For an example, see Sample Configuration Profile (page 66) or read Over-the-Air Profile Delivery and Configuration.

GetCACaps Dictionary Keys

If you add a dictionary with the key GetCACaps, the device uses the strings you provide as the authoritative source of information about the capabilities of your CA. Otherwise, the device queries the CA for GetCACaps and uses the answer it gets in response. If the CA doesn't respond, the device defaults to GET 3DES and SHA-1 requests. For more information, read *Over-the-Air Profile Delivery and Configuration*. This feature is not supported in OS X.

Single Sign-On Account Payload

The Single Sign-On Account payload is designated by specifying com. apple.sso as the PayloadType.

This payload is supported only in iOS 7.0 and later.

In addition to the settings common to all payloads, this payload defines the following keys:

Key	Туре	Value
Name	String	Human-readable name for the account.
Kerberos	Dictionary	Kerberos-related information, described below.

The Kerberos dictionary can contain the following keys:

Кеу	Туре	Value
PrincipalName	String	Optional. The Kerberos principal name. If not provided, the user is prompted for one during profile installation. This field must be provided for MDM installation.
PayloadCertificate- UUID	String	Optional. The PayloadUUID of an identity certificate payload that can be used to renew the Kerberos credential without user interaction. The certificate payload must have either the com.apple.security.pkcs12 or com.apple.security.scep payload type. Both the Single Sign On payload and the identity certificate payload must be included in the same configuration profile
Realm	String	The Kerberos realm name. This value should be properly capitalized.
URLPrefixMatches	Array of strings	List of URLs prefixes that must be matched to use this account for Kerberos authentication over HTTP. Note that the URL postfixes must match as well.
AppIdentifierMatches	Array of strings	Optional. List of app identifiers that are allowed to use this login. If this field missing, this login matches all app identifiers. This array, if present, may not be empty.

Each entry in the URLPrefixMatches array must contain a URL prefix. Only URLs that begin with one of the strings in this account are allowed to access the Kerberos ticket. URL matching patterns must include the scheme—for example, http://www.example.com/. If a matching pattern does not end in /, a / is appended to it.

The URL matching patterns must begin with either http://orhttps://. A simple string match is performed, so the URL prefix http://www.example.com/does not match http://www.example.com/80/.

The pattern http:// and https:// matches all HTTP and HTTPS URLs, respectively.

The AppIdentifierMatches array must contain strings that match app bundle IDs. These strings may be exact matches (com_mycompany_myapp, for example) or may specify a prefix match on the bundle ID by using the * wildcard character. The wildcard character must appear after a period character (.), and may appear only at the end of the string (com_mycompany_**, for example). When a wildcard is given, any app whose bundle ID begins with the prefix is granted access to the account.

System Policy Control Payload

The System Policy Control payload is designated by specifying com.apple.systempolicy.control as the PayloadType.

This payload allows control over configuring the "Allowed applications downloaded from:" option in the "General" tab of "Security & Privacy" in System Preferences.

This payload must only exist in a device profile. If the payload is present in a user profile, an error will be generated during installation and the profile will fail to install.

This payload is supported only on OS X v10.8 and later.

In addition to the settings common to all payloads, this payload defines the following keys:

Key	Туре	Value
EnableAssessment	Boolean	Optional. If the key is present and has a value of YES, Gatekeeper is enabled. If the key is present and has a value of NO, Gatekeeper is disabled.
AllowIdentified- Developers	Boolean	Optional. If the key is present and has a value of YES, Gatekeeper's "Mac App Store and identified developers" option is chosen. If the key is present and has a value of NO, Gatekeeper's "Mac App Store" option is chosen. If EnableAssessment is not true, this key has no effect.

System Policy Rule Payload

The System Policy Rule payload is designated by specifying com.apple.systempolicy.rule as the PayloadType. This is one of three payloads that allows control of various GateKeeper settings.

This payload allows control over Gatekeeper's system policy rules. The keys and functionality are tightly related to the spctl command line tool. You should be read the manual page for spctl.

This payload must only exist in a device profile. If the payload is present in a user profile, an error will be generated during installation and the profile will fail to install.

This payload is supported only on OS X v10.8 and later.

In addition to the settings common to all payloads, this payload defines the following keys:

Кеу	Туре	Value
Requirement	String	The policy requirement. This key must follow the syntax described in Code Signing Requirement Language.
Comment	String	Optional. This string will appear in the System Policy UI. If it is missing, "PayloadDisplayName" or "PayloadDescription" will be put into this field before the rule is added to the System Policy database.
Expiration	Date	Optional. An expiration date for rule(s) being processed.
OperationType	String	Optional. One of operation: execute, operation: install, or operation: lsopen. This will default to operation: execute.

The client has no way to display information about what certificate is being accepted by the signing requirement if the requirement keys is specified as:

```
certificate leaf = H"7696f2cbf7f7d43fceb879f52f3cdc8fadfccbd4"
```

You can embed the certificate within the payload itself, allowing the Profiles preference pane and System Profile report to display information about the certificate(s) being used. To do so, specify the Requirement key using a payload variable of the form \$HASHCERT_xx\$ where "xx" is the name of an additional key within the same payload that contains the certificate data in DER format.

For example, if you specify:

```
<key>Requirement</key>
<string>certificate leaf = $HASHCERT_Cert1Data$</string>
```

and then provide:

```
<key>Cert1Data</key>
<data>
MIIFTDCCBDSgAwIBAgIHBHXzxGzq8DANBgkqhkiG9w0BAQUFADCByjELMAkGA1UEBhMC
...
z1I6yBET5qaGhpWexEp3baLbXLcrtgufmDSUtUnImavGyw==
</data>
```

The client will get the value of Cert1Data key, perform a SHA1 hash on it and use the resulting requirement string of:

```
certificate leaf = H"7696f2cbf7f7d43fceb879f52f3cdc8fadfccbd4"
```

If you want, you may reference multiple \$HASHCERT_xx\$ within the requirement string.

System Policy Managed Payload

The System Policy Managed payload is designated by specifying com.apple.systempolicy.managed as the PayloadType. This is one of three payloads that allows control of various GateKeeper settings.

This payload allows control to disable the Finder's contextual menu that allows bypass of System Policy restrictions.

This payload is supported only on OS X v10.8 and later.

In addition to the settings common to all payloads, this payload defines the following keys:

Key	Туре	Value
DisableOverride	Boolean	Optional. If YES, the Finder's contextual menu item will be disabled.

VPN Payload

The VPN payload is used for traditional systemwide VPNs based on L2TP, PPTP, and IPSec. This payload should not be confused with the Per-App VPN, described in Per-App VPN Payload (page 13).

The VPN payload is designated by specifying com.apple.vpn.managed as the PayloadType value. In addition to the settings common to all payload types, the VPN payload defines the following keys:

Key	Туре	Value
UserDefinedName	String	Description of the VPN connection displayed on the device.
OverridePrimary	Boolean	Specifies whether to send all traffic through the VPN interface. If true, all network traffic is sent over VPN.
VPNType	String	Determines the settings available in the payload for this type of VPN connection. It can have one of the following values: L2TP PPTP IPSec (Cisco) IKEv2 (see IKEv2 Dictionary Keys (page 51)) Always0n (see Always0n VPN Keys (page 54)) This key can also be "VPN" to support additional services via its VPNSubType key.
OnDemandEnabled	Integer	1 if the VPN connection should be brought up on demand, else 0.
OnDemandMatchDomains— Always	Array of Strings	Deprecated. A list of domain names. In versions of iOS prior to iOS 7, if the hostname ends with one of these domain names, the VPN is started automatically. In iOS 7 and later, if this key is present, the associated domain names are treated as though they were associated with the OnDemandMatchDomainsOnRetry key. This behavior can be overridden by OnDemandRules.
OnDemandMatch- DomainsNever	Array of Strings	Deprecated. A list of domain names. If the hostname ends with one of these domain names, the VPN is not started automatically. This might be used to exclude a subdomain within an included domain. This behavior can be overridden by OnDemandRules. In iOS 7 and later, this key is deprecated (but still supported) in favor of EvaluateConnection actions in the OnDemandRules dictionaries.

Кеу	Туре	Value
OnDemandMatchDomains— OnRetry	Array of Strings	Deprecated. A list of domain names. If the hostname ends with one of these domain names, if a DNS query for that domain name fails, the VPN is started automatically.
		This behavior can be overridden by OnDemandRules.
		In iOS 7 and later, this key is deprecated (but still supported) in favor of EvaluateConnection actions in the OnDemandRules dictionaries.
OnDemandRules	Array of Dictionaries	Determines when and how an on-demand VPN should be used. See On Demand Rules Dictionary Keys (page 48) for details.
VendorConfig	Dictionary	A dictionary for configuration information specific to a given third-party VPN solution.

There are two possible dictionaries present at the top level, under the keys "PPP" and "IPSec". The keys inside these two dictionaries are described below, along with the VPNType value under which the keys are used.

PPP Dictionary Keys

The following elements are for VPN payloads of type PPP.

Key	Туре	Value
AuthName	String	The VPN account user name. Used for L2TP and PPTP.
AuthPassword	String	Optional. Only visible if TokenCard is false. Used for L2TP and PPTP.
TokenCard	Boolean	Whether to use a token card such as an RSA SecurID card for connecting. Used for L2TP.
CommRemoteAddress	String	IP address or host name of VPN server. Used for L2TP and PPTP.
AuthEAPPlugins	Array	Only present if RSA SecurID is being used, in which case it has one entry, a string with value "EAP-RSA". Used for L2TP and PPTP.
AuthProtocol	Array	Only present if RSA SecurID is being used, in which case it has one entry, a string with value "EAP". Used for L2TP and PPTP.
CCPMPPE40Enabled	Boolean	See discussion under CCPEnabled. Used for PPTP.

Key	Туре	Value
CCPMPPE128Enabled	Boolean	See discussion under CCPEnabled. Used for PPTP.
CCPEnabled	Boolean	Enables encryption on the connection. If this key and CCPMPPE40Enabled are true, represents automatic encryption level; if this key and CCPMPPE128Enabled are true, represents maximum encryption level. If no encryption is used, then none of the CCP keys are true. Used for PPTP.

IPSec Dictionary Keys

The following elements are for VPN payloads of type IPSec.

Кеу	Туре	Value
RemoteAddress	String	IP address or host name of the VPN server. Used for Cisco IPSec.
AuthenticationMethod	String	Either SharedSecret or Certificate. Used for L2TP and Cisco IPSec.
XAuthName	String	User name for VPN account. Used for Cisco IPSec.
XAuthEnabled	Integer	1 if Xauth is on, 0 if it is off. Used for Cisco IPSec.
LocalIdentifier	String	Present only if AuthenticationMethod is SharedSecret. The name of the group to use. If Hybrid Authentication is used, the string must end with [hybrid]. Used for Cisco IPSec.
LocalIdentifierType	String	Present only if AuthenticationMethod is SharedSecret. The value is KeyID. Used for L2TP and Cisco IPSec.
SharedSecret	Data	The shared secret for this VPN account. Only present if AuthenticationMethod is SharedSecret. Used for L2TP and Cisco IPSec.
PayloadCertificate- UUID	String	The UUID of the certificate to use for the account credentials. Only present if AuthenticationMethod is Certificate. Used for Cisco IPSec.
PromptForVPNPIN	Boolean	Tells whether to prompt for a PIN when connecting. Used for Cisco IPSec.

On Demand Rules Dictionary Keys

The OnDemandRules key in a VPN payload is associated with an array of dictionaries that define the network match criteria that identify a particular network location.

In typical use, VPN On Demand matches the dictionaries in the OnDemandRules array against properties of your current network connection to determine whether domain-based rules should be used in determining whether to connect, then handles the connection as follows:

- If domain-based matching is enabled for a matching OnDemandRules dictionary, then for each dictionary
 in that dictionary's EvaluateConnection array, VPN On Demand compares the requested domain against
 the domains listed in the Domains array.
- If domain-based matching is not enabled, the specified behavior (usually Connect, Disconnect, or Ignore) is used if the dictionary otherwise matches.

Note: For backwards compatibility, VPN On Demand also allows you to specify the Allow action, in which case the domains to match are determined by arrays in the VPN payload itself (OnDemandMatchDomainsAlways, OnDemandMatchDomainsOnRetry, and OnDemandMatchDomainsNever). However, this is deprecated in iOS 7.

Whenever a network change is detected, the VPN On Demand service compares the newly connected network against the match network criteria specified in each dictionary (in order) to determine whether VPN On Demand should be allowed or not on the newly joined network. The matching criteria can include any of the following:

- DNS domain or DNS server settings (with wildcard matching)
- SSID
- Interface type
- reachable server detection

Dictionaries are checked sequentially, beginning with the first dictionary in the array. A dictionary matches the current network only if *all* of the specified policies in that dictionary match. You should always set a default behavior for unknown networks by specifying an action with no matching criteria as the last dictionary in the array.

If a dictionary matches the current network, a server probe is sent if a URL is specified in the profile. VPN then acts according to the policy defined in the dictionary (for example, allow VPNOnDemand, ignore VPNOnDemand, connect, or disconnect).

Important: Be sure to set a catch-all value. If you do not, the current default behavior is to allow the connection to occur, but this behavior is not guaranteed.

The OnDemandRules dictionaries can contain one or more of the following keys:

Key	Type	Value
Action	String	The action to take if this dictionary matches the current network. Possible values are: Allow—Deprecated. Allow VPN On Demand to connect if triggered.
		Connect — Unconditionally initiate a VPN connection on the next network attempt.
		Disconnect—Tear down the VPN connection and do not reconnect on demand as long as this dictionary matches.
		EvaluateConnection—Evaluate the ActionParameters array for each connection attempt.
		Ignore—Leave any existing VPN connection up, but do not reconnect on demand as long as this dictionary matches.
ActionParameters	Array of dictionaries	A dictionary that provides rules similar to the OnDemandRules dictionary, but evaluated on each connection instead of when the network changes. These dictionaries are evaluated in order, and the behavior is determined by the first dictionary that matches.
		The keys allowed in each dictionary are described in Table 1-1 (page 50).
		Note: This array is used only for dictionaries in which EvaluateConnection is the Action value.

Кеу	Туре	Value
DNSDomainMatch	Array of strings	An array of domain names. This rule matches if any of the domain names in the specified list matches any domain in the device's search domains list. A wildcard '*' prefix is supported. For example, *.example.com matches against either mydomain.example.com or yourdomain.example.com.
DNSServerAddress- Match	Array of strings	An array of IP addresses. This rule matches if any of the network's specified DNS servers match any entry in the array. Matching with a single wildcard is supported. For example, 17.* matches any DNS server in the class A 17 subnet.
InterfaceTypeMatch	String	An interface type. If specified, this rule matches only if the primary network interface hardware matches the specified type. Supported values are Ethernet, WiFi, and Cellular.
SSIDMatch	String	An array of SSIDs to match against the current network. If the network is not a Wi-Fi network or if the SSID does not appear in this array, the match fails. Omit this key and the corresponding array to match against any SSID.
URLStringProbe	String	A URL to probe. If this URL is successfully fetched (returning a 200 HTTP status code) without redirection, this rule matches.

The keys allowed in each ActionParameters dictionary are described in Table 1-1.

 Table 1-1
 Keys in the ActionParameters dictionary

Key	Туре	Value
Domains	Array of strings	Required. The domains for which this evaluation applies.

Key	Туре	Value
DomainAction	String	Required. Defines the VPN behavior for the specified domains. Allowed values are: ConnectlfNeeded—The specified domains should trigger a VPN connection attempt if domain name resolution fails, such as when the DNS server indicates that it cannot resolve the domain, responds with a redirection to a different server, or fails to respond (timeout). NeverConnect—The specified domains should never trigger a VPN connection attempt.
RequiredDNSServers	Array of strings	Optional. An array of IP addresses of DNS servers to be used for resolving the specified domains. These servers need not be part of the device's current network configuration. If these DNS servers are not reachable, a VPN connection is established in response. These DNS servers should be either internal DNS servers or trusted external DNS servers. Note: This key is valid only if the value of DomainAction is ConnectIfNeeded.
RequiredURLString- Probe	String	Optional. An HTTP or HTTPS (preferred) URL to probe, using a GET request. If the URL's hostname cannot be resolved, if the server is unreachable, or if the server does not respond with a 200 HTTP status code, a VPN connection is established in response. Note: This key is valid only if the value of DomainAction is ConnectIfNeeded.

IKEv2 Dictionary Keys

If VPNType is IKEv2, the following keys may be provided in a dictionary:

Кеу	Туре	Value
RemoteAddress	String	Required. IP address or hostname of the VPN server.

Кеу	Туре	Value
LocalIdentifier	String	Required. Identifier of the IKEv2 client in one of the following formats: • FQDN • UserFQDN • Address • ASN1DN
RemoteIdentifier	String	Required. Remote identifier in one of the following formats: • FQDN • UserFQDN • Address • ASN1DN
AuthenticationMethod	String	Required. One of the following: • SharedSecret • Certificate
PayloadCertificate— UUID	String	Optional. The UUID of the identity certificate as the account credential. If AuthenticationMethod is Certificate, and extended authentication (EAP) is not used, this certificate will be sent out for IKE client authentication. If extended authentication is used, this certificate can be used for EAP-TLS.
SharedSecret	String	Optional. If AuthenticationMethod is SharedSecret, this value is used for IKE authentication.
ExtendedAuthEnabled	Integer	Optional. Set to 1 to enable extended authentication (EAP). Default to 0.
AuthName	String	Optional. Username used for authentication.
AuthPassword	String	Optional. Password used for authentication.

Key	Туре	Value
DeadPeerDetection- Interval	String	Optional. One of the following: None (Disable) Low (keepalive sent every 30 minutes) Medium (keepalive sent every 10 minutes) High (keepalive sent every 1 minute) Defaults to Medium.
ServerCertificate- IssuerCommonName	String	Optional. Common Name of the server certificate issuer. If set, this field will cause IKE to send a certificate request based on this certificate issuer to the server.
ServerCertificate- CommonName	String	Optional. Common Name of the server certificate. This name is used to validate the certificate sent by the IKE server. If not set, the Remote Identifier will be used to validate the certificate.
IKESecurity- Association- Parameters	Dictionary	Optional. See table below. Applies to child Security Association unless ChildSecurityAssociation—Parameters is specified.
ChildSecurity- Association- Parameters	Dictionary	Optional. See table below.

The IKESecurityAssociationParameters and ChildSecurityAssociationParameters dictionaries may contain the following keys:

Key	Туре	Value
EncryptionAlgorithm	String	Optional. One of:
		• DES
		3DES (Default)
		• AES-128
		• AES-256

Кеу	Туре	Value
IntegrityAlgorithm	String	Optional. One of:
		• SHA1–96 (Default)
		• SHA1-160
		• SHA2-256
		• SHA2-384
		• SHA2-512
DiffieHellmanGroup	Integer	Optional. One of: 0, 1, 2 (Default), 5, 14, 15, 16, 17, or 18.
LifeTimeInMinutes	Integer	Optional SA lifetime (rekey interval) in minutes. Valid values are 10 through 1440. Defaults to 1440 minutes.

AlwaysOn Dictionary Keys

If VPNType is Always0n, the following keys may be provided in a dictionary:

Кеу	Туре	Value
UIToggleEnabled	Integer	Optional. If set to 1, allows the user to disable this VPN configuration. Defaults to 0.
TunnelConfigurations	Array of dictionaries	Required. See below.
ServiceExceptions	Array of dictionaries	Optional. See below.
AllowCaptiveWebSheet	Integer	Optional. Set to 1 to allow traffic from Captive Web Sheet outside the VPN tunnel. Defaults to 0.
AllowAllCaptive- NetworkPlugins	Integer	Optional. Set to 1 to allow traffic from all Captive Networking apps outside the VPN tunnel to perform Captive network handling. Defaults to 0.

Кеу	Туре	Value
	Array of dictionaries	Optional. Array of Captive Networking apps whose traffic will be allowed outside the VPN tunnel to perform Captive network handling. Used only when AllowAllCaptiveNetworkPlugins is 0.
		Each dictionary in the AllowedCaptive— NetworkPlugins array must contain a BundleIdentifier key of type string, the value of which is the app's bundle identifier.
		Captive Networking apps may require additional entitlements to operate in a captive environment.

Each dictionary in a TunnelConfigurations array may contain the following keys:

Кеу	Туре	Value
ProtocolType	String	Must be IKEv2.
Interfaces	Array of strings	Optional. Specify the interfaces to which this configuration applies. Valid values are Cellular and WiFi. Defaults to Cellular, WiFi.

In addition, all keys defined for the IKEv2 dictionary, such as RemoteAddress and LocalIdentifier may be present in a TunnelConfigurations dictionary.

Each dictionary in a ServiceExceptions array may contain the following keys:

Кеу	Туре	Value
ServiceName	String	Required. The name of a system service which is exempt from Always On VPN. Must be one of: • VoiceMail • AirPrint
Action	String	Required. One of the following: • Allow • Drop

Web Clip Payload

The Web Clip payload is designated by specifying com.apple.webClip.managed as the PayloadType value.

A Web Clip payload provides a web clipping on the user's home screen as though the user had saved a bookmark to the home screen.

In addition to the settings common to all payloads, this payload defines the following keys:

Кеу	Туре	Value
URL	String	The URL that the Web Clip should open when clicked. The URL must begin with HTTP or HTTPS or it won't work.
Label	String	The name of the Web Clip as displayed on the Home screen.
Icon	Data	Optional. A PNG icon to be shown on the Home screen. Should be 59 x 60 pixels in size. If not specified, a white square will be shown.
IsRemovable	Boolean	Optional. If No, the user cannot remove the Web Clip, but it will be removed if the profile is deleted. Not available in OS X.

Web Content Filter Payload

The Web Content Filter payload allows you to whitelist and blacklist specific web URLs. This payload is supported only on supervised devices.

Web content filtering is designated by specifying com.apple.webcontent-filter as the PayloadType value and adding a FilterType string with one of these values:

- BuiltIn (Default)
- PlugIn

On OS X, FilterType must be PlugIn.

If FilterType is BuiltIn, this payload defines the following keys in addition to the settings common to all payloads:

Кеу	Туре	Value
AutoFilterEnabled	Boolean	Optional. If true, automatic filtering is enabled. This function evaluates each web page as it is loaded and attempts to identify and block content not suitable for children. The search algorithm is complex and may vary from release to release, but it is basically looking for adult language, i.e. swearing and sexually explicit language. The default value is false.
PermittedURLs	Array of strings	Optional. Used only when AutoFilterEnabled is true. Otherwise, this field is ignored. Each entry contains a URL that is accessible whether the automatic filter allows access or not.
WhitelistedBookmarks	Array of dictionaries	Optional. If present, these URLs are added to the browser's bookmarks, and the user is not allowed to visit any sites other than these.
BlacklistedURLs	Array of strings	Optional. Access to the specified URLs is blocked.

Each entry in the WhitelistedBookmarks field contains a dictionary with the following keys:

Кеу	Туре	Value
URL	String	URL of the whitelisted bookmark.
BookmarkPath	String	Optional. The folder into which the bookmark should be added in Safari—/Interesting Topic Pages/Biology/, for example. If absent, the bookmark is added to the default bookmarks directory.
Title	String	The title of the bookmark.

When multiple content filter payloads are present:

- The blacklist is the union of all blacklists—that is, any URL that appears in any blacklist is inaccessible.
- The permitted list is the intersection of all permitted lists—that is, only URLs that appear in *every* permitted list are accessible when they would otherwise be blocked by the automatic filter.
- The whitelist list is the intersection of all whitelists—that is, only URLs that appear in *every* whitelist are accessible.

URLs are matched using string-based prefix matching—that is, a URL matches a whitelist, blacklist, or permitted list pattern if the exact characters of the pattern appear at the beginning of the URL. No attempt is made to match aliases (IP address versus DNS names, for example) or to handle requests with explicit port numbers. URLs should begin with http://orhttps://. If necessary, separate entries must be made for http:// and https:// versions of the same URL.

If a profile does not contain an array for PermittedURLs or WhitelistedBookmarks, that profile is skipped when evaluating the missing array or arrays. As an exception, if a payload contains an AutoFilterEnabled key, but does not contain a PermittedURLs array, that profile is treated as containing an empty array—that is, all websites are blocked.

All filtering options are active simultaneously. Only URLs and sites that pass all rules are permitted.

If FilterType is PlugIn, this payload defines the following keys in addition to the settings common to all payloads:

Кеу	Туре	Value
UserDefinedName	String	A string which will be displayed for this filtering configuration.
PluginBundleID	String	The Bundle ID of the plugin that provides filtering service.
ServerAddress	String	Optional. Server address (may be IP address, hostname, or URL).
UserName	String	Optional. A username for the service.
Password	String	Optional. A password for the service.
PayloadCertificate- UUID	String	Optional. UUID pointing to an identity certificate payload. This identity will be used to authenticate the user to the service.
Organization	String	Optional. An Organization string that will be passed to the 3rd-party plugin.
VendorConfig	Dictionary	Optional. Custom dictionary needed by the filtering service plugin.
FilterBrowsers	Integer	Optional. If set to 1, filter WebKit traffic. Defaults to 0.
FilterSockets	Integer	Optional. If set to 1, filter socket traffic. Defaults to 0.

At least one of FilterBrowsers or FilterSockets must be true for the filter to have any effect.

Wi-Fi Payload

The Wi-Fi payload is designated by specifying com.apple.wifi.managed as the PayloadType value.

In addition to the settings common to all payload types, the payload defines the following keys.

Key	Туре	Value
SSID_STR	String	SSID of the Wi-Fi network to be used. In iOS 7.0 and later, this is optional if a DomainName value is provided
HIDDEN_NETWORK	Boolean	Besides SSID, the device uses information such as broadcast type and encryption type to differentiate a network. By default (false), it is assumed that all configured networks are open or broadcast. To specify a hidden network, must be true.
AutoJoin	Boolean	Optional. Default true. If true, the network is auto-joined. If false, the user has to tap the network name to join it. Availability: Available in iOS 5.0 and later.
EncryptionType	String	The possible values are WEP, WPA,Any, and None. WPA corresponds to WPA and WPA2 and applies to both encryption types. Make sure that these values exactly match the capabilities of the network access point. If you're unsure about the encryption type, or would prefer that it apply to all encryption types, use the value Any. Availability: Available in iOS 4.0 and later; the None value is available in iOS 5.0 and later.
IsHotspot	Boolean	Optional. Default false. If true, the network is treated as a hotspot. Availability: Available in iOS 7.0 and later.
DomainName	String	Optional. Domain Name used for Wi-Fi Hotspot 2.0 negotiation. This field can be provided instead of SSID_STR. Availability: Available in iOS 7.0 and later.
ServiceProvider- RoamingEnabled	Boolean	Optional. If true, allows connection to roaming service providers. Availability: Available in iOS 7.0 and later.

Кеу	Туре	Value
RoamingConsortiumOIs	Array of strings	Optional. Array of Roaming Consortium Organization Identifiers used for Wi-Fi Hotspot 2.0 negotiation. Availability: Available in iOS 7.0 and later.
NAIRealmNames	Array of strings	Optional. Array of strings. List of Network Access Identifier Realm names used for Wi-Fi Hotspot 2.0 negotiation. Availability: Available in iOS 7.0 and later.
MCCAndMNCs	Array of strings	Optional. Array of strings. List of Mobile Country Code (MCC)/Mobile Network Code (MNC) pairs used for Wi-Fi Hotspot 2.0 negotiation. Each string must contain exactly six digits. Availability: Available in iOS 7.0 and later. This feature is not supported in OS X.
DisplayedOperator- Name	String	Availability: Available in iOS 7.0 and later.
ProxyType	String	Optional. Valid values are None, Manual, and Auto. Availability: Available in iOS 5.0 and later.

If the EncryptionType field is set to WEP, WPA, or ANY, the following fields may also be provided:

Кеу	Туре	Value
Password	String	Optional.
EAPClientConfiguration	Dictionary	Described in EAPClientConfiguration Dictionary (page 61).
PayloadCertificateUUID	String	Described in Certificates (page 64).

Note: The absence of a password does not prevent a network from being added to the list of known networks. The user is eventually prompted to provide the password when connecting to that network.

[]

If the ProxyType field is set to Manual, the following fields must also be provided:

Key	Туре	Value
ProxyServer	String	The proxy server's network address.
ProxyPort	Integer	The proxy server's port.
ProxyUsername	String	Optional. The username used to authenticate to the proxy server.
ProxyPassword	String	Optional. The password used to authenticate to the proxy server.
ProxyPACURL	String	Optional. The URL of the PAC file that defines the proxy configuration.
ProxyPACFallback- Allowed	Boolean	Optional. If false, prevents the device from connecting directly to the destination if the PAC file is unreachable. Default is true.
		Availability: Available in iOS 7 and later.

If the ProxyType field is set to Auto and no ProxyPACURL value is specified, the device uses the web proxy autodiscovery protocol (WPAD) to discover proxies.

For 802.1X enterprise networks, the EAP Client Configuration Dictionary must be provided.

EAPClientConfiguration Dictionary

In addition to the standard encryption types, it is possible to specify an enterprise profile for a given network via the "EAPClientConfiguration" key. If present, its value is a dictionary with the following keys.

Key	Туре	Value
UserName	String	Optional. Unless you know the exact user name, this property won't appear in an imported configuration. Users can enter this information when they authenticate.

Key	Туре	Value
	Array of	The following EAP types are accepted:
	integers.	13 = TLS
		17 = LEAP
		18 = EAP-SIM
		21 = TTLS
		23 = EAP-AKA
		25 = PEAP
		43 = EAP-FAST
UserPassword	String	Optional. User password. If not provided, the user may be prompted during login.
OneTimePassword	Boolean	Optional. If true, the user will be prompted for a password each time they connect to the network. Defaults to false.
PayloadCertificate— AnchorUUID	Array of strings	Optional. Identifies the certificates to be trusted for this authentication. Each entry must contain the UUID of a certificate payload. Use this key to prevent the device from asking the user if the listed certificates are trusted.
		Dynamic trust (the certificate dialogue) is disabled if this property is specified, unless TLSAllowTrustExceptions is also specified with the value true.
TLSTrustedServer- Names	Array of strings	Optional. This is the list of server certificate common names that will be accepted. You can use wildcards to specify the name, such as wpa.*.example.com. If a server presents a certificate that isn't in this list, it won't be trusted.
		Used alone or in combination with TLSTrustedCertificates, the property allows someone to carefully craft which certificates to trust for the given network, and avoid dynamically trusted certificates.
		Dynamic trust (the certificate dialogue) is disabled if this property is specified, unless TLSAllowTrustExceptions is also specified with the value true.

Кеу	Туре	Value
TLSAllowTrust- Exceptions	Boolean	Optional. Allows/disallows a dynamic trust decision by the user. The dynamic trust is the certificate dialogue that appears when a certificate isn't trusted. If this is false, the authentication fails if the certificate isn't already trusted. See PayloadCertificateAnchorUUID and TLSTrustedNames above. The default value of this property is true unless either
		PayloadCertificateAnchorUUID or TLSTrustedServerNames is supplied, in which case the default value is false.
TLSCertificateIs- Required	Boolean	Optional. If true, allows for two-factor authentication for EAP-TTLS, PEAP, or EAP-FAST. If false, allows for zero-factor authentication for EAP-TLS. The default is true for EAP-TLS, and false for other EAP types. Availability: Available in iOS 7.0 and later.
TTLSInner-	String	Optional. This is the inner authentication used by the TTLS
Authentication		module. The default value is "MSCHAPv2". Possible values are "PAP", "CHAP", "MSCHAP", and
		"MSCHAPv2".
OuterIdentity	String	Optional. This key is only relevant to TTLS, PEAP, and EAP-FAST.
		This allows the user to hide his or her identity. The user's actual name appears only inside the encrypted tunnel. For example, it could be set to "anonymous" or "anon", or "anon@mycompany.net".
		It can increase security because an attacker can't see the authenticating user's name in the clear.

Note: For information about EAP-SIM, see tools.ietf.org/html/rfc4186.

EAP-Fast Support

The EAP-FAST module uses the following properties in the EAPClientConfiguration dictionary.

Кеу	Туре	Value
EAPFASTUsePAC	Boolean	Optional.If true, the device will use an existing PAC if it's present. Otherwise, the server must present its identity using a certificate. Defaults to false.

Кеу	Туре	Value
EAPFASTProvisionPAC	Boolean	Optional. Used only if EAPFASTUsePAC is true. If set to true, allows PAC provisioning. Defaults to false. This value must be set to true for EAP-FAST PAC usage to succeed, because there is no other way to provision a PAC.
EAPFASTProvision- PACAnonymously	Boolean	Optional. If true, provisions the device anonymously. Note that there are known man-in-the-middle attacks for anonymous provisioning. Defaults to false.
EAPSIMNumberOfRANDs	Integer	Optional. Number of expected RANDs for EAPSIM. Valid values are 2 and 3. Defaults to 3.

These keys are hierarchical in nature: if EAPFASTUsePAC is false, the other two properties aren't consulted. Similarly, if EAPFASTProvisionPAC is false, EAPFASTProvisionPACAnonymously isn't consulted.

If EAPFASTUsePAC is false, authentication proceeds much like PEAP or TTLS: the server proves its identity using a certificate each time.

If EAPFASTUsePAC is true, then an existing PAC is used if present. The only way to get a PAC on the device currently is to allow PAC provisioning. So, you need to enable EAPFASTProvisionPAC, and if desired, EAPFASTProvisionPACAnonymously. EAPFASTProvisionPACAnonymously has a security weakness: it doesn't authenticate the server so connections are vulnerable to a man-in-the-middle attack.

Certificates

As with VPN configurations, it is possible to associate a certificate identity configuration with a Wi-Fi configuration. This is useful when defining credentials for a secure enterprise network. To associate an identity, specify its payload UUID via the "PayloadCertificateUUID" key.

Key	Туре	Value
PayloadCertificateUUID	String	UUID of the certificate payload to use for the identity credential.

Domains Payload

This payload defines web domains that are under an enterprise's management. This payload is designated by the com.apple.domains PayloadType value.

Unmarked Email Domains

Any email address that does not have a suffix that matches one of the unmarked email domains specified by the key EmailDomains will be considered out-of-domain and will be highlighted as such in the Mail app.

Key	Туре	Value
EmailDomains	Array	Optional. An array of strings. An email address lacking a suffix that matches any of these strings will be considered out-of-domain.

Managed Safari Web Domains

Opening a document originating from a managed Safari web domain causes iOS to treat the document as managed for the purpose of Managed Open In.

Key	Туре	Value
WebDomains	Array	Optional. An array of strings. URLs matching the patterns listed here will be considered managed.

The WebDomains array may contain strings using any of the following matching patterns:

Format	Description
example.com	Treat any path under example.com as managed, but not site.example.com/.
foo.example.com	Treat any path under foo.example.com as managed, but not example.com/ or bar.example.com/.
*.example.com	Treat any path under foo.example.com or bar.example.com as managed, but not example.com/.
example.com/sub	Treat example.com/sub and any path under it as managed, but not example.com/.
foo.example.com/sub	Treat any path under foo.example.com/sub as managed, but not example.com, example.com/sub, foo.example.com/, or bar.example.com/sub.
*.example.com/sub	Treat any path under foo.example.com/sub or bar.example.com/sub as managed, but not example.com or foo.example.com/.

A URL that begins with the prefix www. will be treated as though it did not contain that prefix during matching. For example, http://www.example.com/store will be matched as http://example.com/store.Trailing slashes will be ignored.

If a ManagedWebDomain string entry contains a port number, only addresses that specify that port number will be considered managed. Otherwise, only the standard ports will be considered managed (port 80 for http and 443 for https). For example, the pattern *.example.com: 8080 will match http://site.example.com: 8080/page.html, but not http://site.example.com/page.html, while the pattern *.example.com will match http://site.example.com/page.html and https://site.example.com/page.html but not http://site.example.com: 8080/page.html.

Managed Safari Web Domain definitions are cumulative. Patterns defined by all managed Safari web domain payloads will be used to match a URL request.

Encrypted Profiles

A profile can be encrypted so that it can only be decrypted using a private key previously installed on a device.

To encrypt a profile do the following:

- 1. Remove the PayloadContent array and serialize it as a proper plist. Note that the top-level object in this plist is an array, not a dictionary.
- 2. CMS-encrypt the serialized plist as enveloped data.
- 3. Serialize the encrypted data in DER format.
- 4. Set the serialized data as the value of as a Data plist item in the profile, using the key EncryptedPayloadContent.

Signing a Profile

To sign a profile, place the XML plist in a DER-encoded CMS Signed Data data structure.

Sample Configuration Profile

The following is a sample configuration profile containing an SCEP payload.

<?xml version="1.0" encoding="UTF-8"?>

```
<!DOCTYPE plist PUBLIC "-//Apple Inc//DTD PLIST 1.0//EN"</pre>
"http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<pli><pli><pli>version="1.0">
